

Practical 10: Working with Sqliteusing Python

A college wants to maintain the students records. The repository should contain students details like: student id (sid), name, contact number, status (alumni / current student). Firstly, all the details of students enrolled for a course should be inserted in the tabular form. In case if admin department notices that by mistake one entry has been wrongly made; so updation w.r.t the record is required. There is a scenario wherein duplicate entries have been made and admin has to remove it. Finally after performing above operations admin is suppose to fetch the records related to current students.

Kndly perform the above operations using python script .
